- 02** Calibration Approach & Tips/Suggestions
- 03** (Some) Calibration/Validation Resources
- 04** (Some) Validation Data Sources
- 05** (Some) Typical Validation Checks
- 06** Other Considerations & Final Thoughts

# Calibration versus Validation versus Reasonableness Checking

- **Calibration:** adjustment of model constants to better replicate observed results.
- **Validation:** comparison of a model to observed data not directly used in the model development.
- **Reasonableness Checking:** comparing model outputs to expected results. The expected results may be ranges of outputs from other models across the country or outputs from other mathematical means such as linear regression or professional experience.

# Calibration Approach

## Tips/Suggestions:

- Check all major steps
- Make “apples-to-apples” comparisons
- Look for errors before making calibration adjustments
- Focus on systematic adjustments
- Don't over-calibrate
- Know when to stop

Protocols and Procedures**

2023

Version 2.0

# (Some) Validation Data Sources

- Census
- CTPP
- LEHD OnTheMap
- Wood & Poole / BLS
- NHTS Add-on
- Other local data or studies (e.g., transit ridership data, local truck study, university employee travel survey, etc.)
- On-Board Travel Survey
- NTD
- Big Data (StreetLight, AirSage, ATRI)
- Replica
- INRIX
- Google Maps / Aerials
- Previous model
- Historic data
- Other models
- “Industry Standards”
- Traffic Counts
- Your brain!

# (Some) Typical Validation Checks

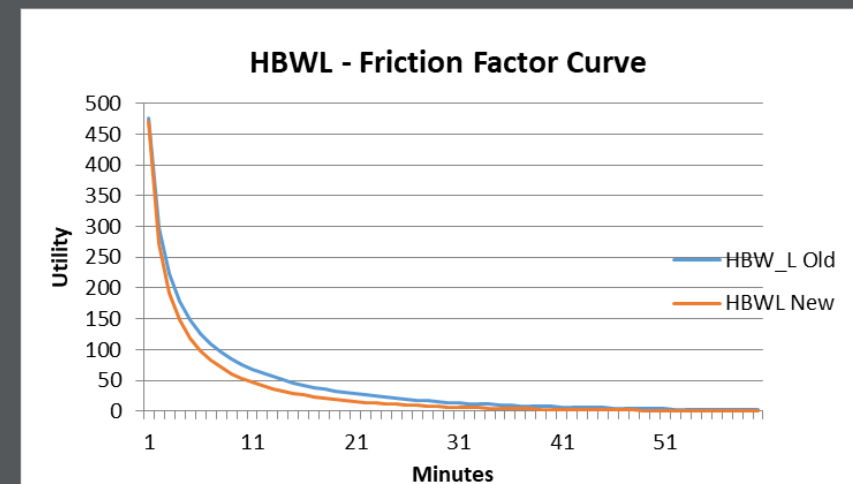

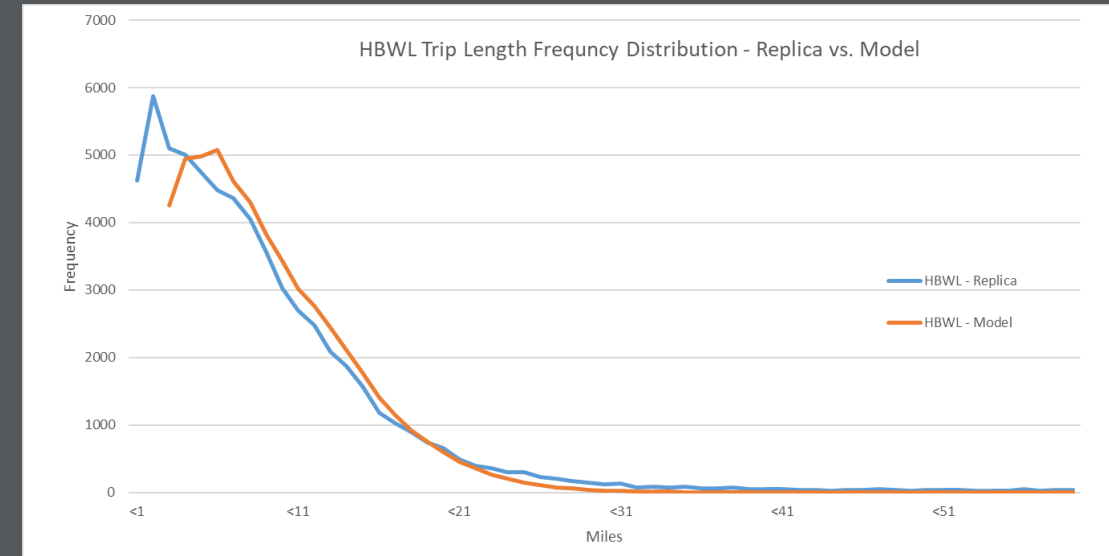

- **Trip Generation:**

- **Households:** Parcel household data checks (vs. Census data)
- **Non-Residential Land Use:** General parcel land use data checks for reasonableness (vs. other models)
- **Unbalanced Trips:** Unbalanced trip productions versus trip attractions from model (10% rule)
- **Trip Purpose Percentages:** Percentage of each balanced trips by trip purpose (vs. NHTS/Other Models/"industry standards")
- **Trips per Household:** Total trips divided by households (vs. NHTS/Other Models/"industry standards")

# (Some) Typical Validation Checks

- **Trip Distribution:**

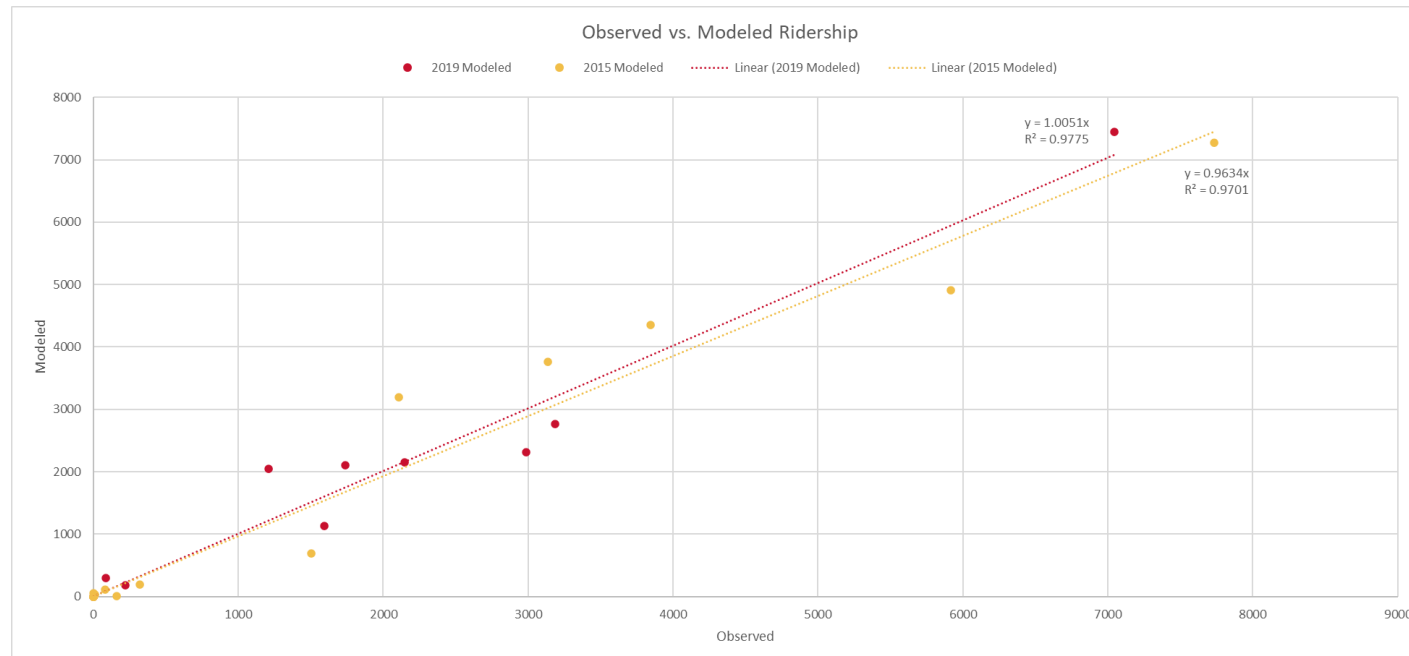

- **Average Trip Time or Length:** Average trip time or distance by trip purpose (vs. NHTS/CTPP/Replica/StreetLight)
- **Trip Length Frequency Distribution Curves (TLFD):** Histogram of trips by time or distance bins (vs. NHTS/CTPP/Replica/StreetLight)
  - Coincidence Ratio ( $> 0.70$ )
- **Friction Factor Curves:** Graphical display of the utility (or disutility) of making trips of various lengths of time (vs. Old model/"industry standards")

# (Some) Typical Validation Checks

- **Mode Choice/Transit Assignment**

- **Non-Motorized Trips:** Number and percentage of walk and bike trips (vs. NHTS/Replica)
- **System Ridership:** Total number of “unlinked” transit trips (vs. NTD/local data)
- **Ridership by Route:** Total ridership by route (vs. local data)

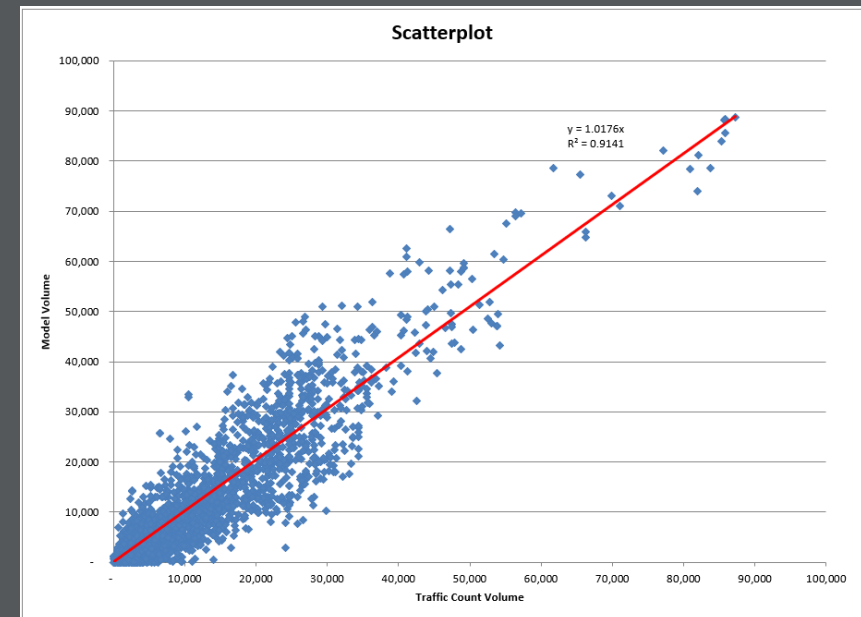

# (Some) Typical Validation Checks

- **Traffic Assignment**

- **VMT Error:** VMT by functional class and volume groups (vs. count data)
- **Percent RMSE:** Average volume error (vs. count data)
- **Scatterplot:** Graphical display of volume error (vs. count data)
- **Level-of-Service:** Areas of congestion (vs. local knowledge)
- **Screenlines/Cutlines/Cordons:** Regional or local volume error checks (vs. count data)

Table 4-64: Assignment Validation Standards by Facility Type

Facility Type	Total %RMSE - Acceptable	Total %RMSE - Preferred
Total System	35%	30%
Interstate/Freeway/Ramps	30%	25%
Expressway	35%	30%
Principal arterial	35%	30%
Minor arterial	45%	40%
Collectors/Local	65%	50%
Centroid connectors	N/A	N/A

# (Some) Typical Validation Checks

- Sensitivity Testing
  - Future Growth Summary
  - Future Trips in No-growth TAZs
  - Future Level-of-Service
  - New Road Scenario
  - Accessibility Scenario

Table 4-68: Growth Metric Reasonableness Checks

METRIC (BASE AND FORECAST)	SOURCE/FORMULA	DESCRIPTION
Households	Validation Report	Growth in households
Balanced Trips (Weekday)	Validation Report	Growth in trips. Percentage should be similar to growth in households
Vehicle Miles Traveled (Weekday)*	Validation Report	Most communities can expected higher VMT growth than balanced trips or household growth because development often occurs farther away from the city center.
Vehicle Hours Traveled (Weekday)*	Validation Report	Most communities can expect higher VHT growth than VMT growth because congestion usually is expected to increase in the future.
Average Trip Speed	VMT / VHT	Most communities can expected a lower average trip speed in the future because of more congestion
Average Trip Length	VMT / Balanced Trips	Most communities can expect a higher average trip lengths in the future because development occurs farther away from the city center
Average Trip Time	VHT / Balanced Trips	Most communities can expect higher average trip times in the future because congestion increases.

\* Exclude connectors

Figure 4-37: Map of Accessibility by TAZ Output

# Other Considerations & Final Thoughts

- Travel time checks (vs. INRIX, Google Maps)
- Truck trips (vs. truck counts, ATRI, StreetLight, Replica)
- External station input checks (vs. StreetLight, Replica)
- Time-of-day checks (vs. hourly counts, StreetLight, Replica)
- Auto occupancies (vs. NHTS, other models, “industry standards”)
- Capacities (vs. other models, “industry standards”)
